CLAIM AMENDMENTS

- 1. (canceled)
- 2. (canceled)
- 3. (currently amended) The contact assembly defined in claim [[2]] 10 wherein the block is formed on the outer face with an inwardly directed abutment, the tip bearing elastically outward on the abutment in the outer position.
- 4. (original) The contact assembly defined in claim 3
 wherein the tip bears with prestress against the abutment.
 - 5. (canceled)
- 6. (currently amended) The contact assembly defined in claim [[1]] 10 wherein the cutout is formed as a notch wholly bounded by the web.
- 7. (original) The contact assembly defined in claim 6 wherein the web is substantially wider at the notch than the tip.
- 8. (currently amended) The contact assembly defined in claim [[2]] 10 wherein the bights are at opposite ends of the web.

9. (canceled)

1	10. (previously presented) A contact assembly
2	comprising:
3	a dielectric mounting block having inner and outer faces,
4	the outer face being formed with an inwardly directed abutment; and
5	a conductive contact unitarily formed of elastically
6	deformable metal with
7	a center web set in the block, having two
8	opposite ends, and formed between the ends
9	with a throughgoing cutout,
0	respective inner and outer U-shaped bights
1	concave toward each other, at the ends of
2	the center web, and projecting oppositely
3	from the center web,
4	an inner leg extending from the inner bight of
5	the web past the inner face and
6	elastically deflectable toward the inner
7	face and toward the center web, and
8	an outer leg extending from the outer bight of
9	the web toward the inner leg, elastically
0	deflectable from an outer position spaced
1	well outward of the outer face and spaced
2	from the web to an inner position with the
3	tip extending inward through the cutout
4	and past the web, and having a tip bearing

5	elastically outward on the abutment in the
6	outer position, the legs extending
7	oppositely from the respective bights
8	toward each other.
